Deployment of mission-critical surveillance applications on wireless sensor networks

Deployment of mission-critical surveillance applications on wireless sensor networks

Surveillance applications (1)

- Lesson 1: don't miss important events

Whole understanding of the scene is wrong!!!

What is captured

Surveillance applications (2)

- ❑ Lesson 2: high-quality not necessarily good

333x358 16M colors, no light

167x180 16 colors, light

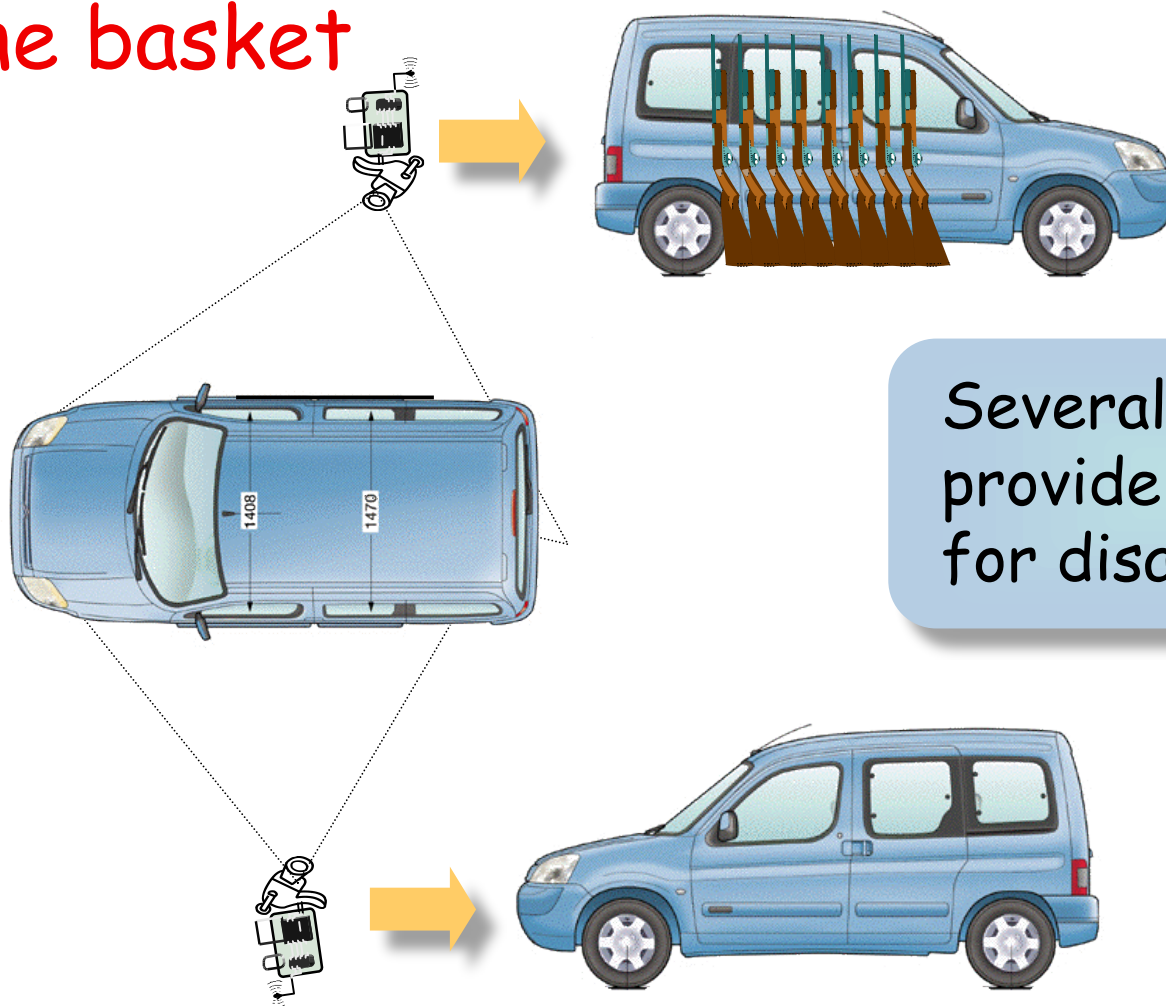

167x180 BW (2 colors), light

Keep in mind
the goal of the
application!

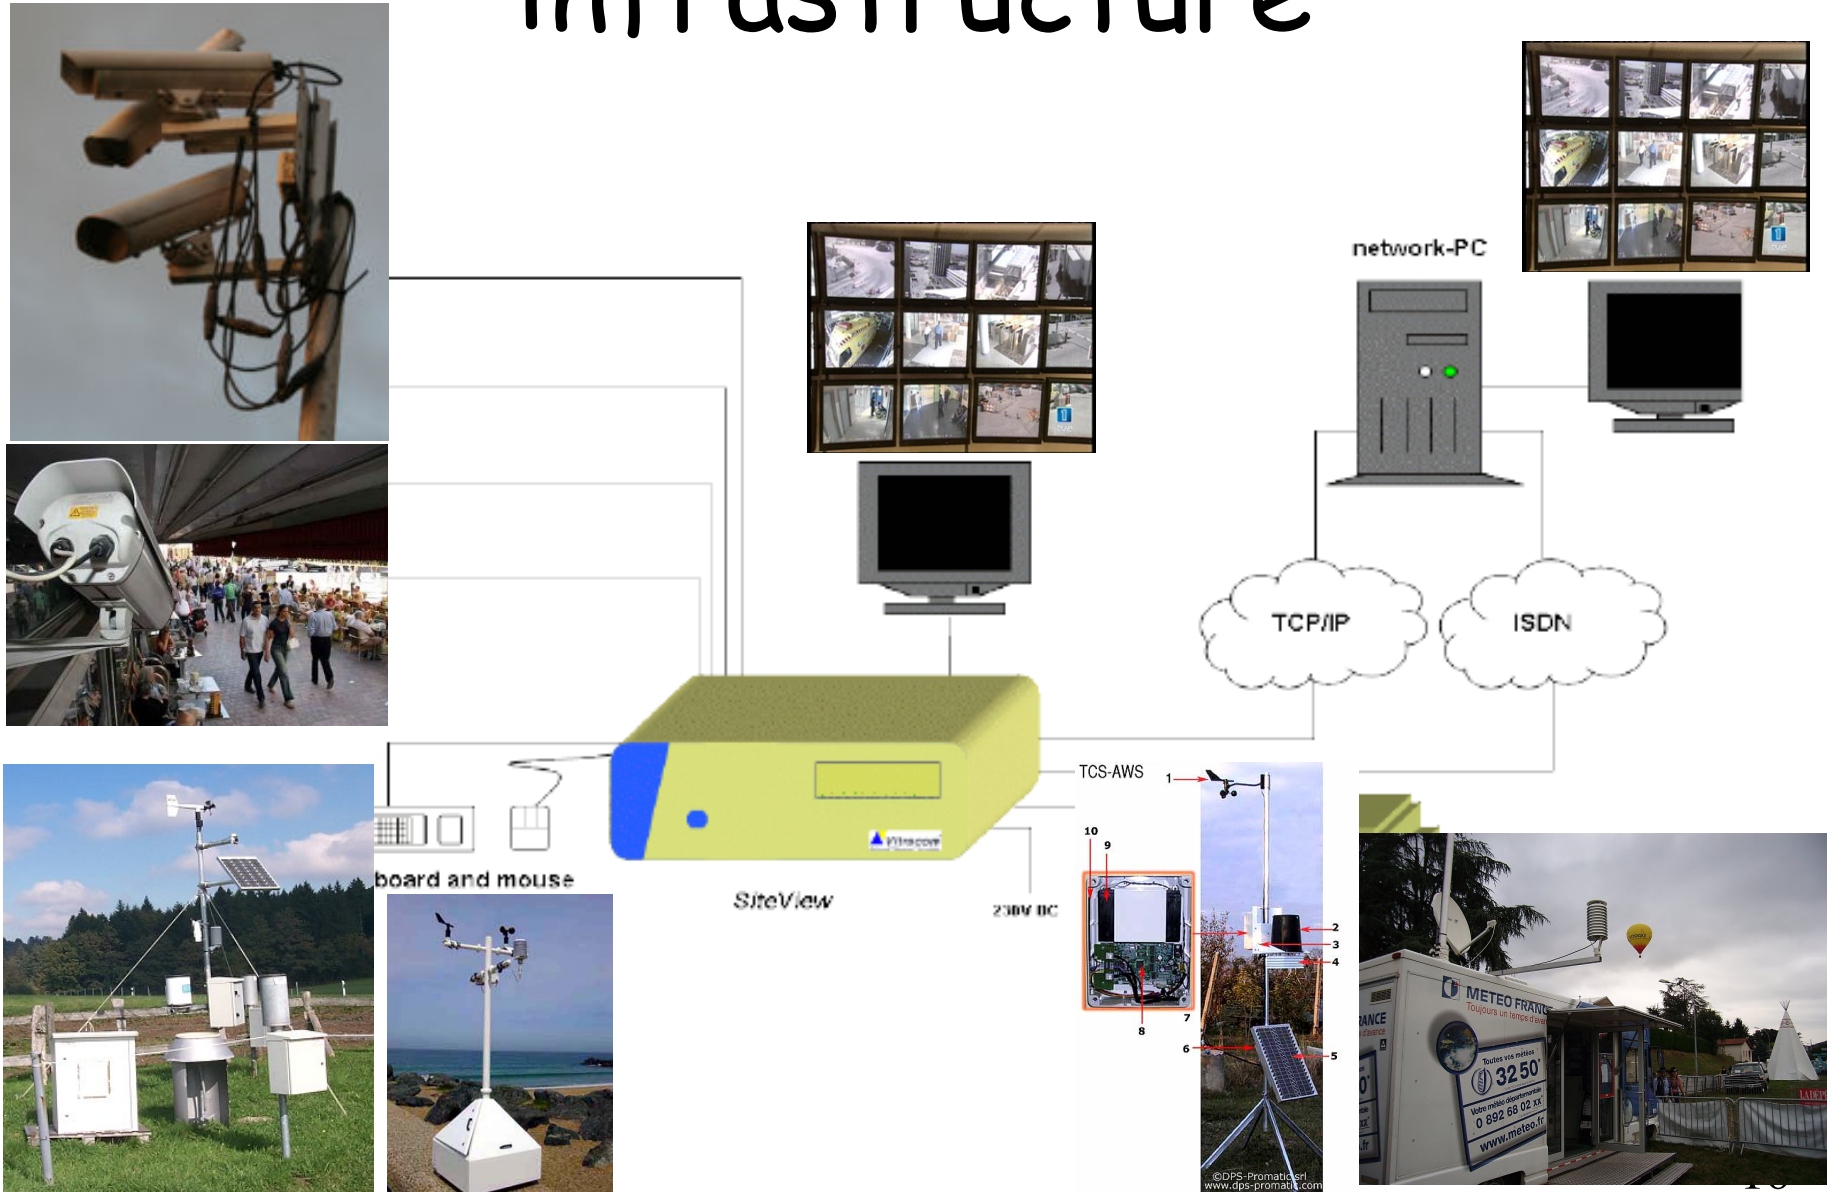

Surveillance applications (3)

□ Lesson 3: **don't put all your eggs in one basket**

Several sources provide multi-view for disambiguation

Traditionnal surveillance infrastructure

Small, Autonomous Sensors

disaster relief - security

Organization of rescue in large scale disasters relief operations

Rapid deployment of fire detection systems in high-risk places

Wireless autonomous sensor

- ❑ In general: low cost, low power (the battery may not be replaceable), small size, prone to failure, possibly disposable
- ❑ Role: sensing, data processing, communication

Berkeley Motes (contd.)

- ❑ Each Mote has two separate boards
 - ❑ A main CPU board with radio communication circuitry
 - ❑ A secondary board with sensing circuitry
- ❑ Decouples sensing hardware from communication hardware
- ❑ Allows for customization since application specific sensor hardware can be plugged-on to the main board

MICA2

Imote2

MICAz

Sensing boards

SUN SPOT

- ❑ Processor : ARM920T
180MHz 32-bit
- ❑ 512K RAM & 4M Flash.
- ❑ Communication :
2.4GHz, radio chipset:
TI CC2420 (ChipCon) -
IEEE 802.15.4
compatible
- ❑ Java Virtual Machine
(Squawk)
- ❑ LIUPPA is official
partner

SUNSPOT

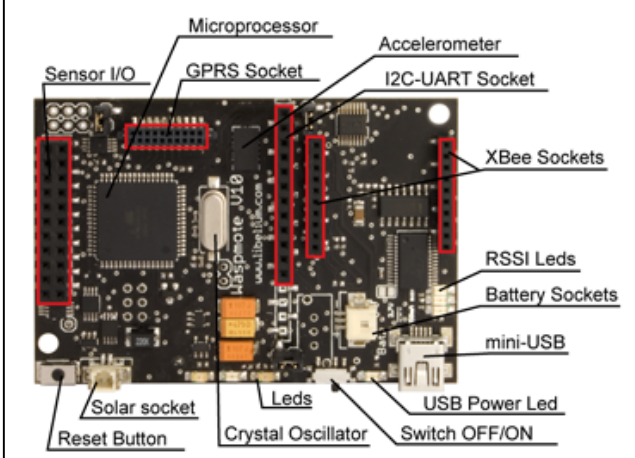

- ❑ ATmega1281 microcontroller
- ❑ 8K RAM & 1G SD card.
- ❑ 2.4GHz IEEE 802.15.4 compatible. RF and GSM/GPRS

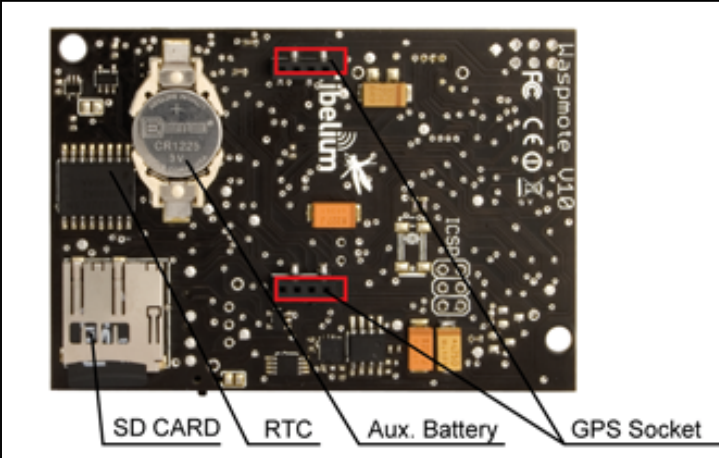

Gases

- Carbon Monoxide – CO
- Carbon Dioxide – CO2
- Oxygen – O2
- Methane – CH4
- Hydrogen – H2
- Ammonia – NH3
- Isobutane – C4H10
- Ethanol – CH3CH2OH
- Toluene – C6H5CH3
- Hydrogen Sulfide – H2S
- Nitrogen Dioxide – NO2
- Temperature
- Humidity

- Microprocessor
- Accelerometer
- Sensor I/O
- GPRS Socket
- I2C-UART Socket
- XBee Sockets

Sensor as common object toward very large scale deployment

Environmental monitoring

- air
- water

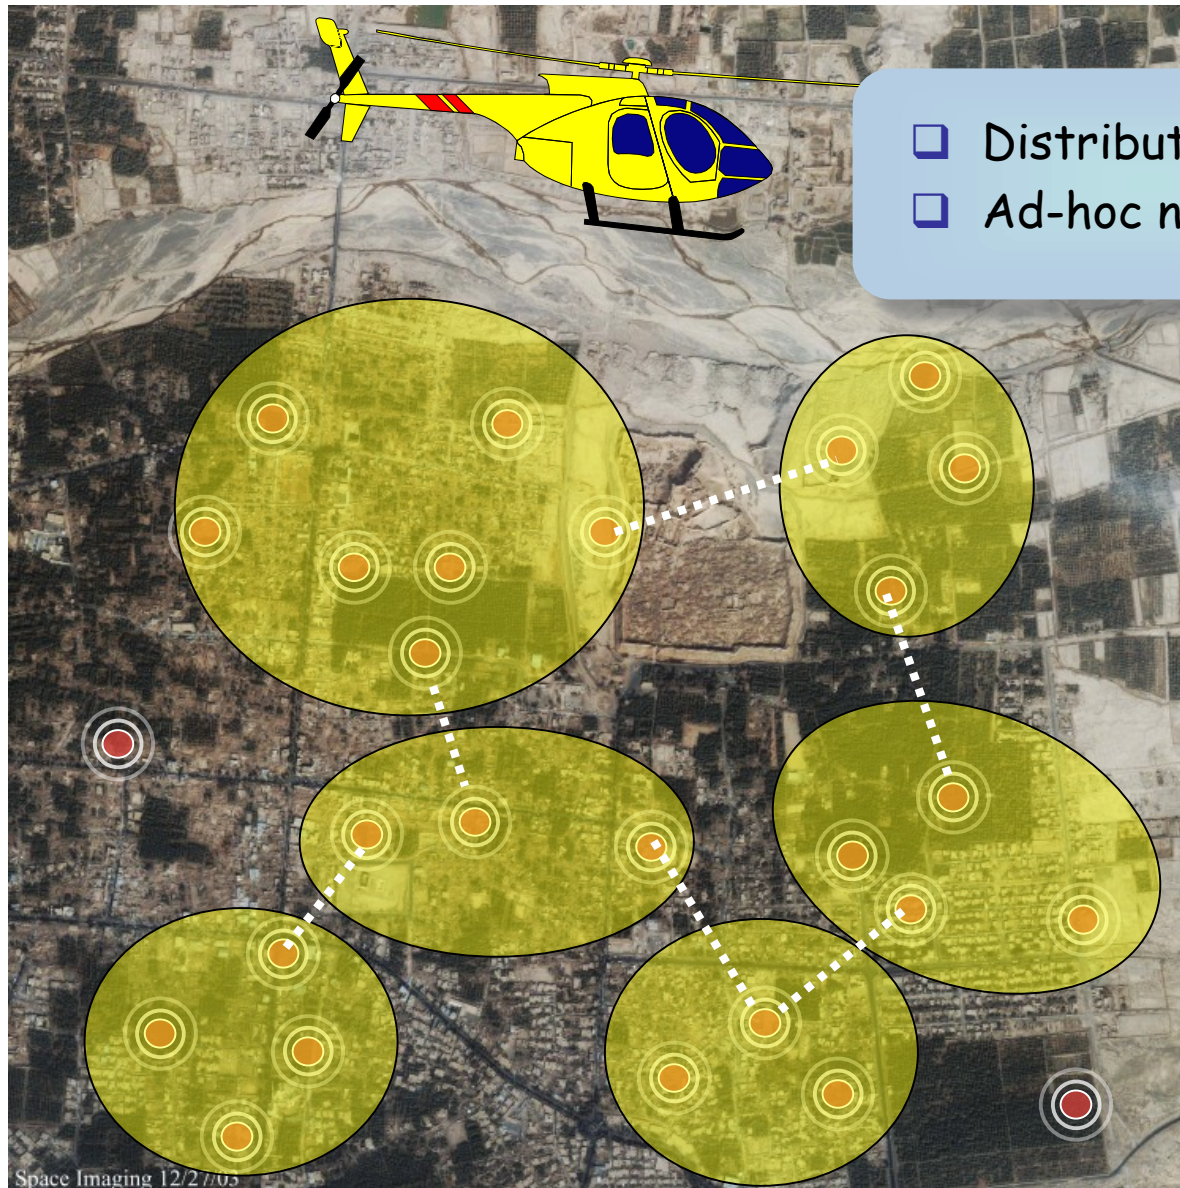

Cell-phones with embedded CO sensor

- most ubiquitous device (millions)
- not deployment cost
- high replacement rate
- no energy constraints

Wireless Sensor Network (1)

Wireless Sensor Network (2)

- Distributed system
- Ad-hoc network

Mission-critical surveillance applications

- ❑ Availability: 24/24 surveillance
 - ❑ Hardware : failures, energy depletion
 - ❑ Data
- ❑ Quality
 - ❑ Enhance/validate/disambiguate information with several sources of information
 - ❑ Adaptation to local conditions
- ❑ Reliability/integrity
 - ❑ Hardware
 - ❑ Network
 - ❑ Data

Surveillance as a Service

ACCOUNTABILITY

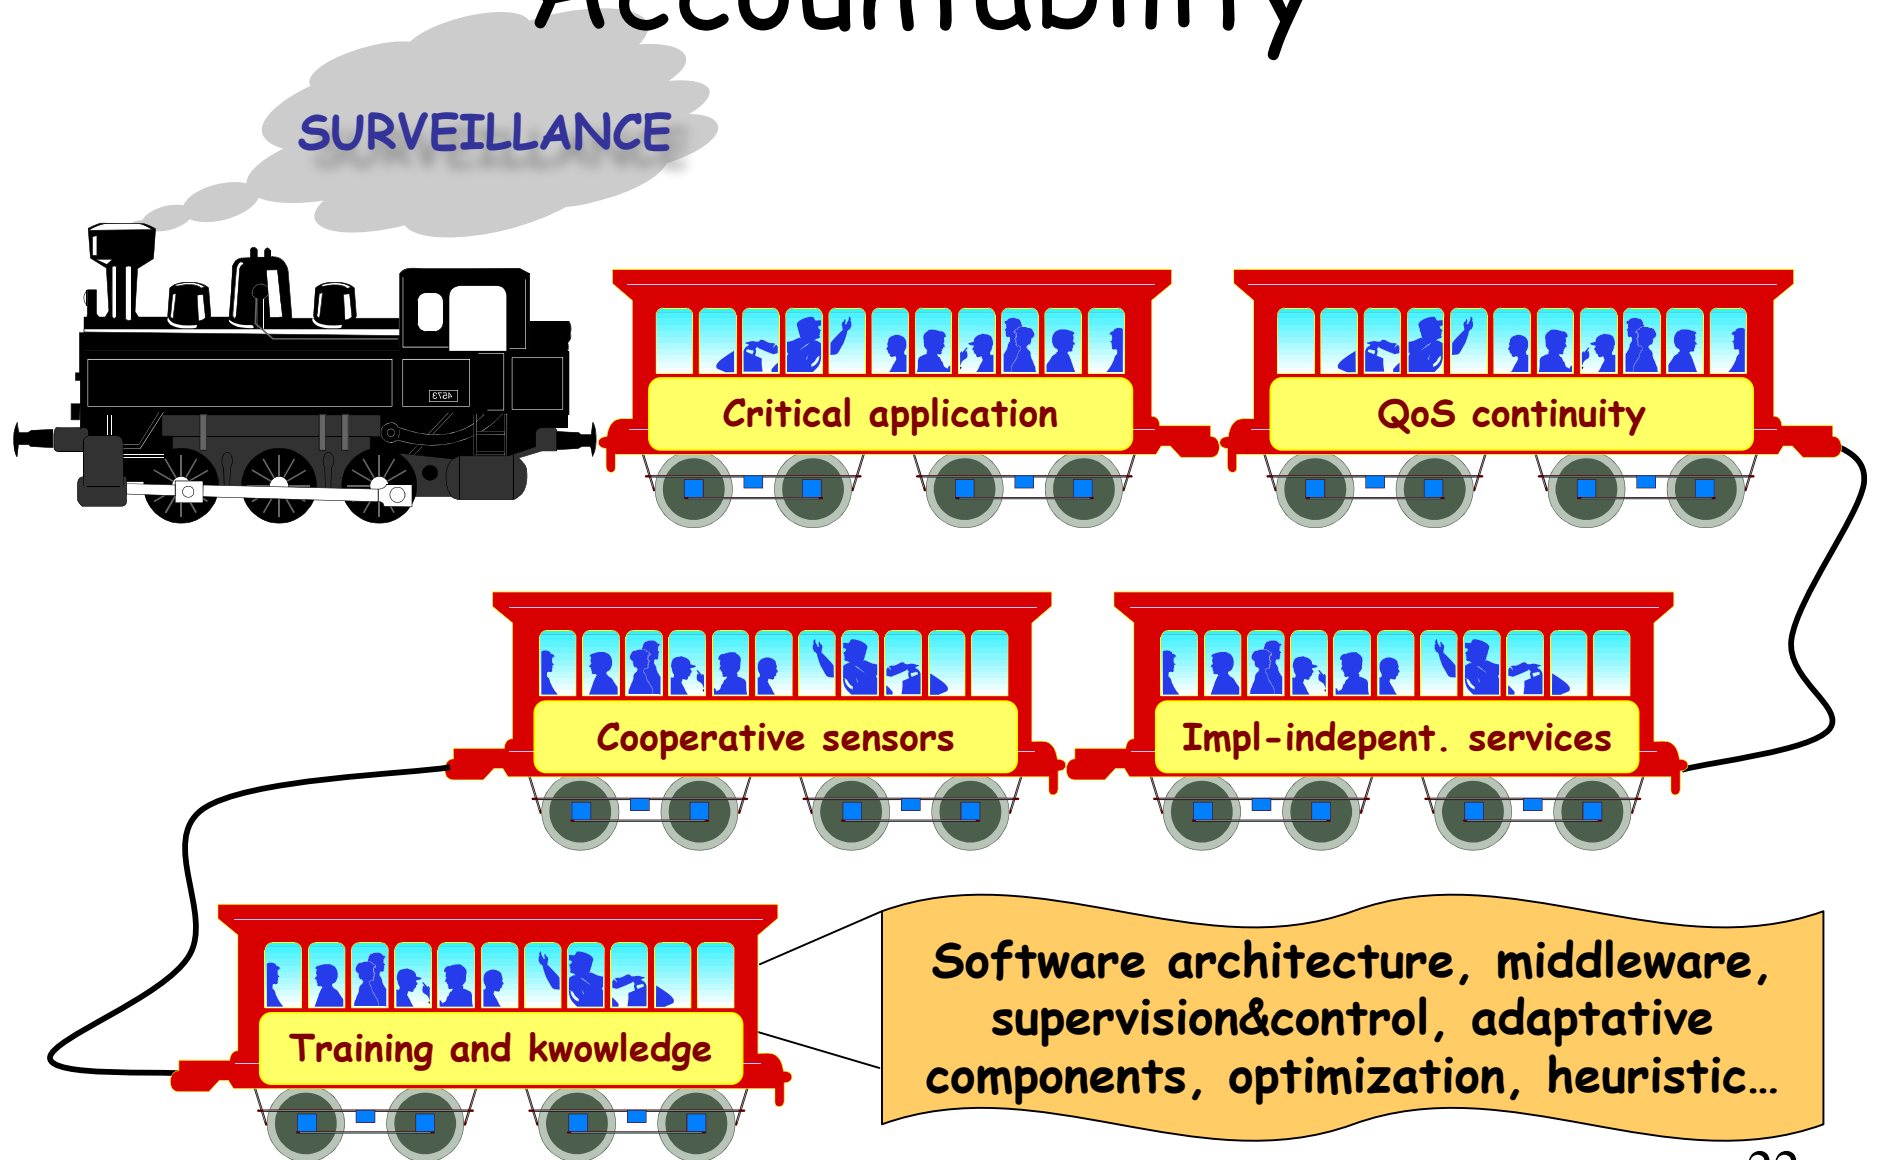

□ Similar to **Service Level Agreement**

→ SURVEILLANCE AT ANY PRICE ←

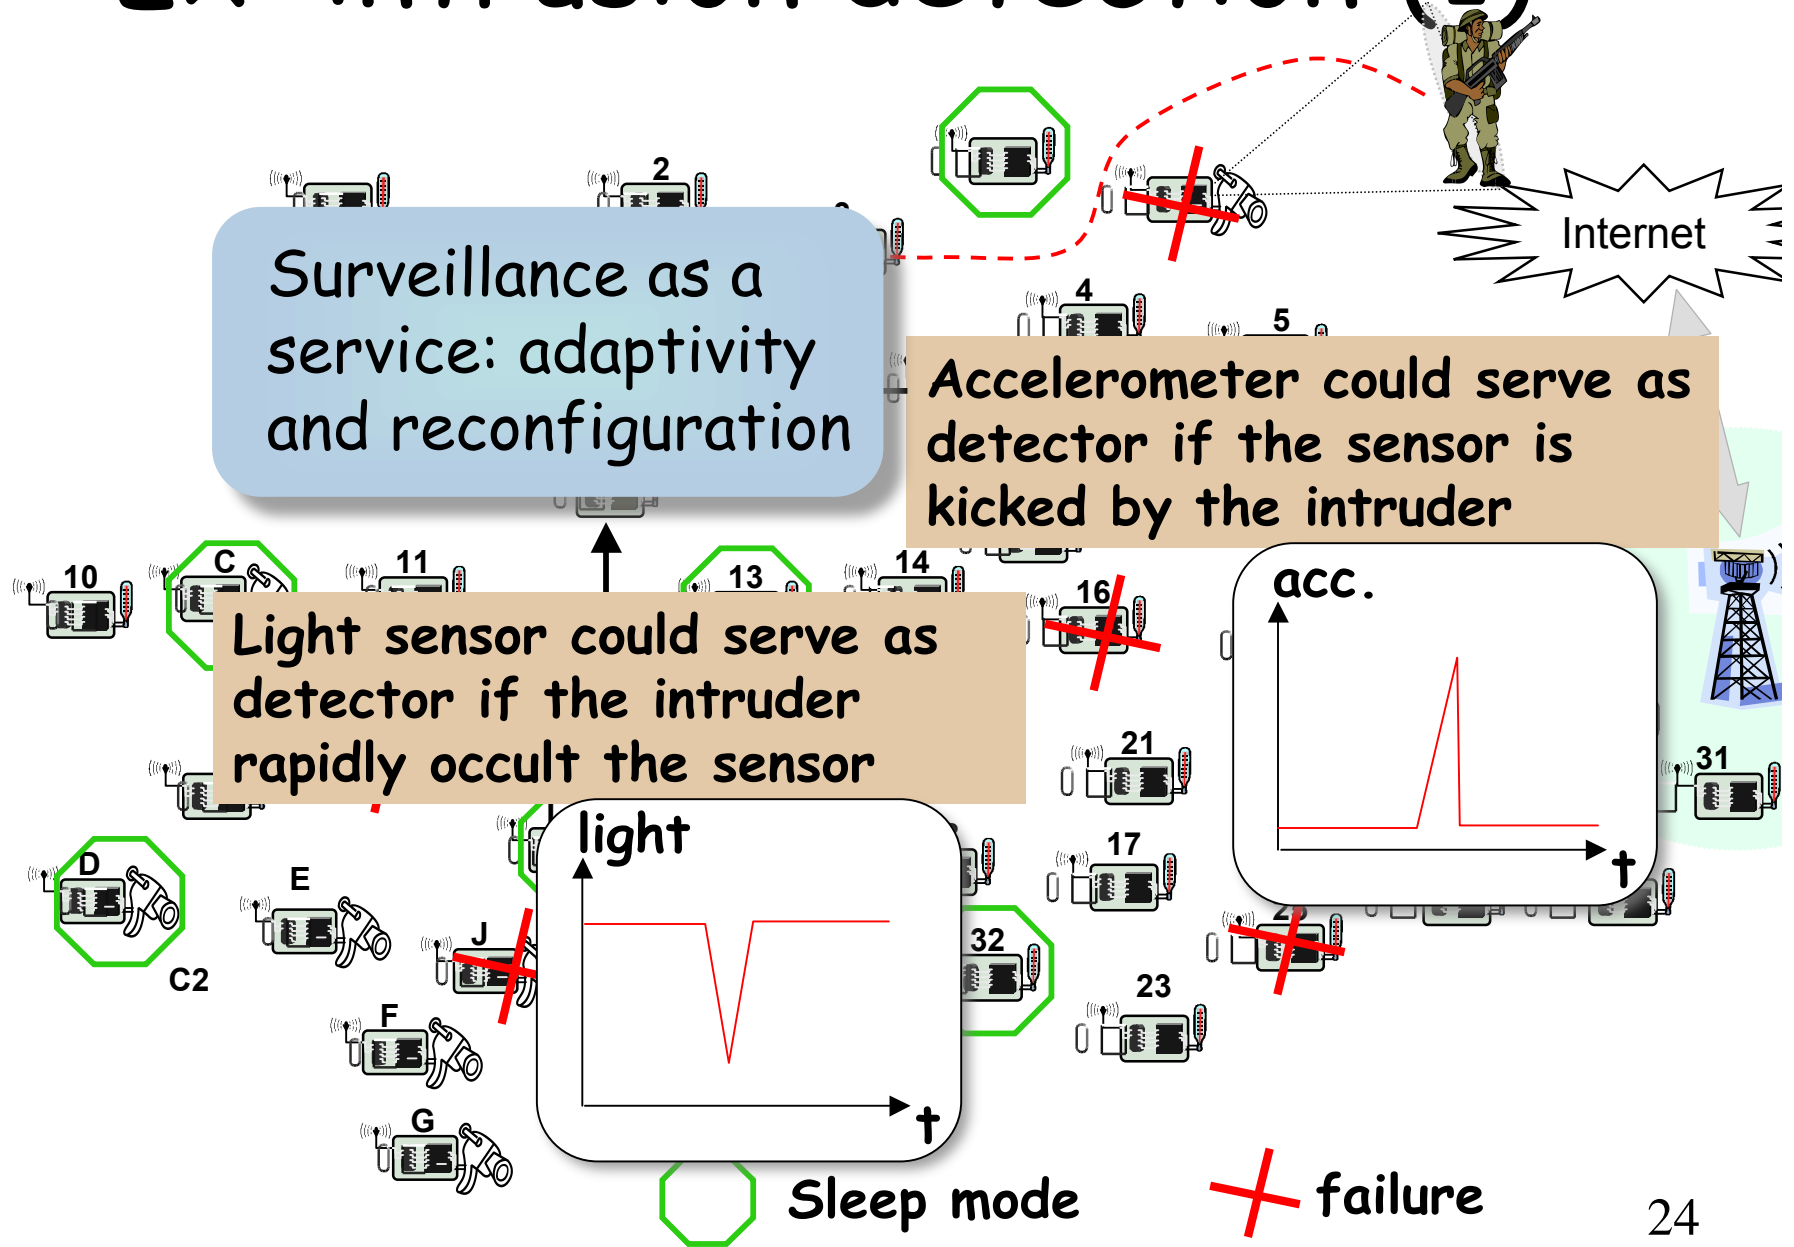

no discontinuity of service
against node's failures

data availability and reliability

Surveillance as a service: Accountability

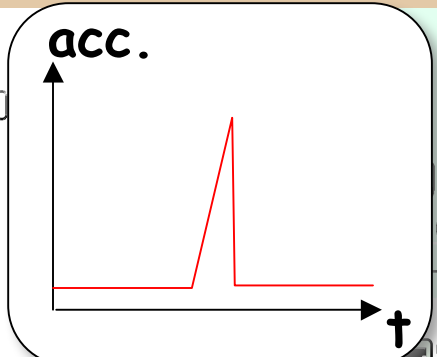

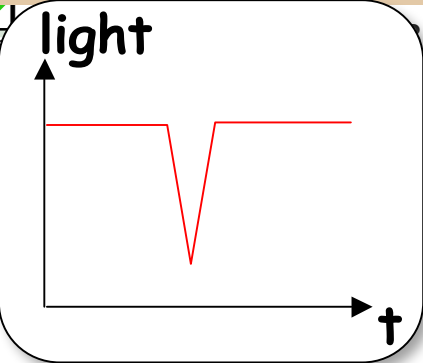

Ex: intrusion detection (1)

Surveillance as a service: adaptivity and reconfiguration

Accelerometer could serve as detector if the sensor is kicked by the intruder

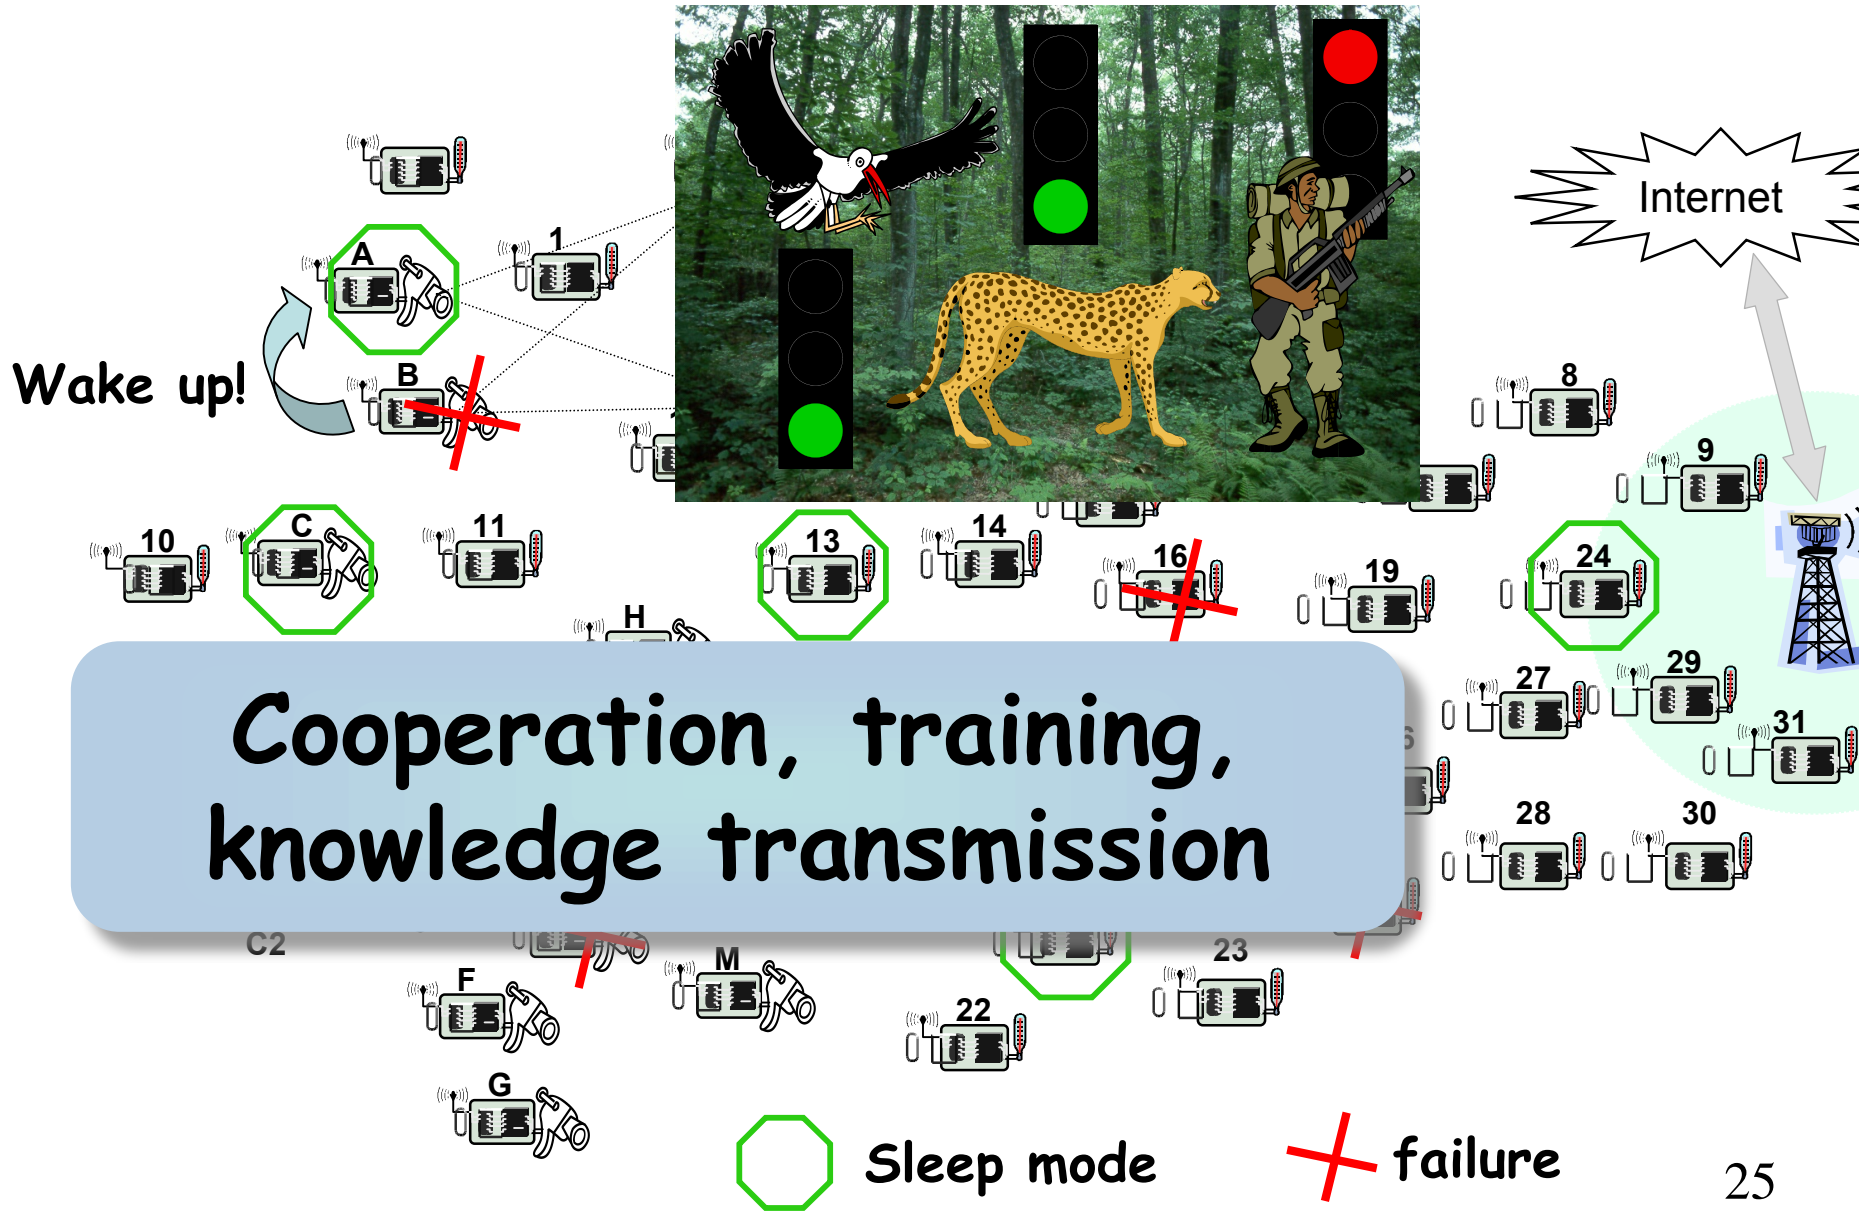

Light sensor could serve as detector if the intruder rapidly occults the sensor

Sleep mode

+ failure

Ex: intrusion detection (2)

Towards smart sensor grids

- ❑ The ultimate goal is to define a customizable sensor grid that could be dynamically programmed according to the application's objectives and needs
- ❑ Similar to the so-called active networking concept for the Internet...
- ❑ ...but much easier to achieve!!

The Internet we wanted, the one we have...

End-to-end Quality of Service	No Quality of Service
Distributed processing	Very centralized architecture
Internet-wide, uniform control and policies	Heterogeneous and domain/ISP specific policies
Fast integration of new needs, new applications, new technologies	Upgrades and incremental deployments are slow

Net Neutrality or Not?

- ❑ The Internet's success is in a large part debtful to what's called Net Neutrality (IP neutrality)

- ❑ But, Net Neutrality is the main brake for achieving large scale QoS : IP routers only forward packets!

- ❑ Some services can be best supported or enhanced using information that is only available inside the network!

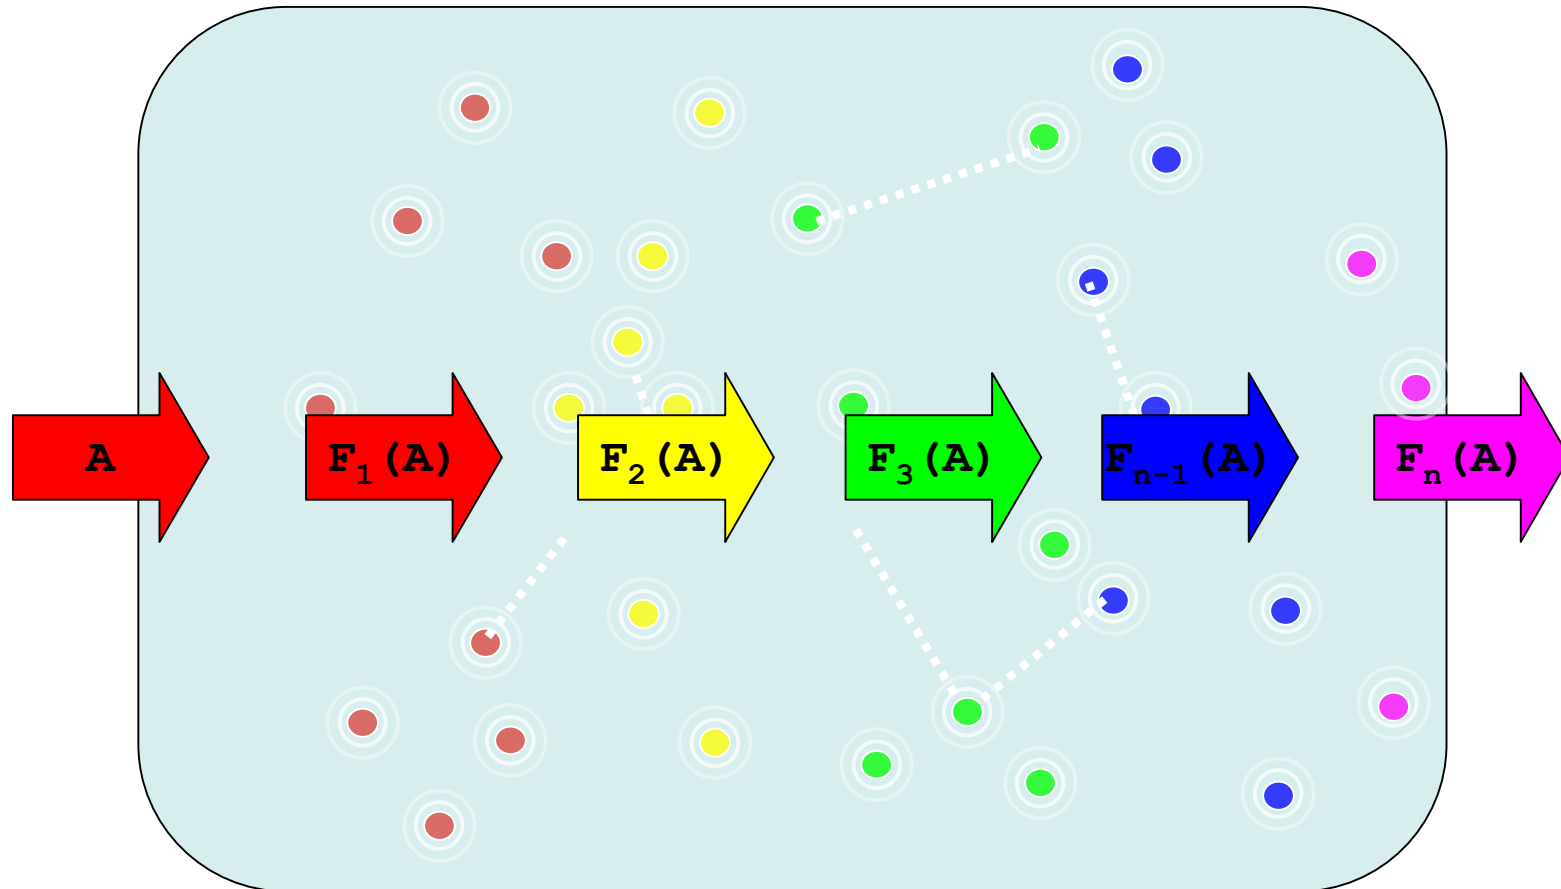

- ❑ Fortunately, in a sensor network, each node has de-facto specific processing capabilities

One vision for enabling QoS in Sensor Nets (1)

Supervision platform

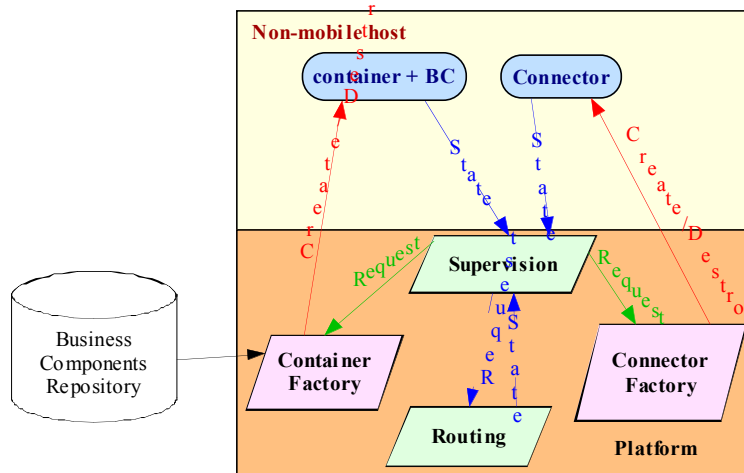

M. Dalmau & P. Roose

- ❑ Take care of user's QoS and QoS continuity
- ❑ Allows for a service-oriented surveillance system
- ❑ Discovery and publish mechanisms
- ❑ In charge of determining which configuration is better

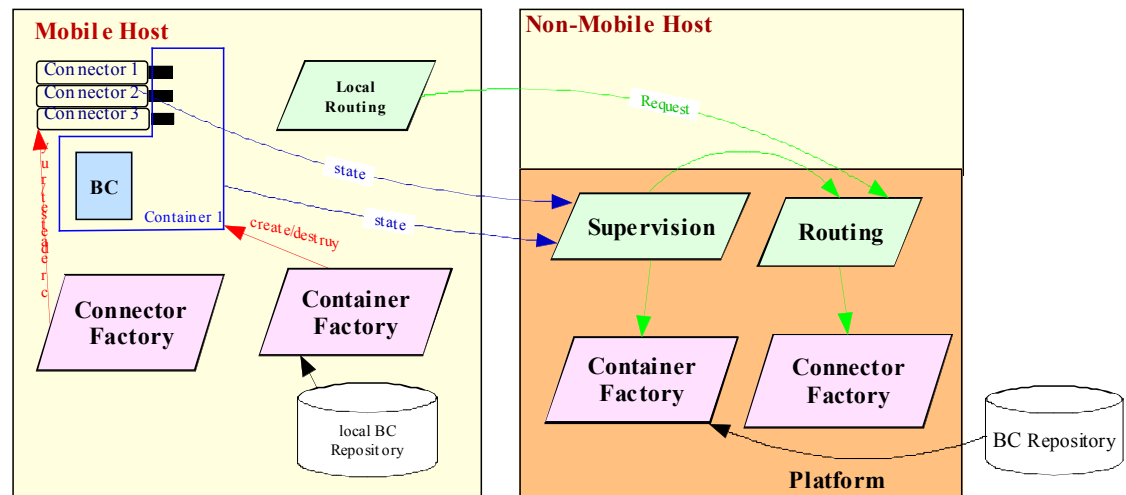

A bit of the internal design

Fixed-node/base station

Mobile/lightweight-node

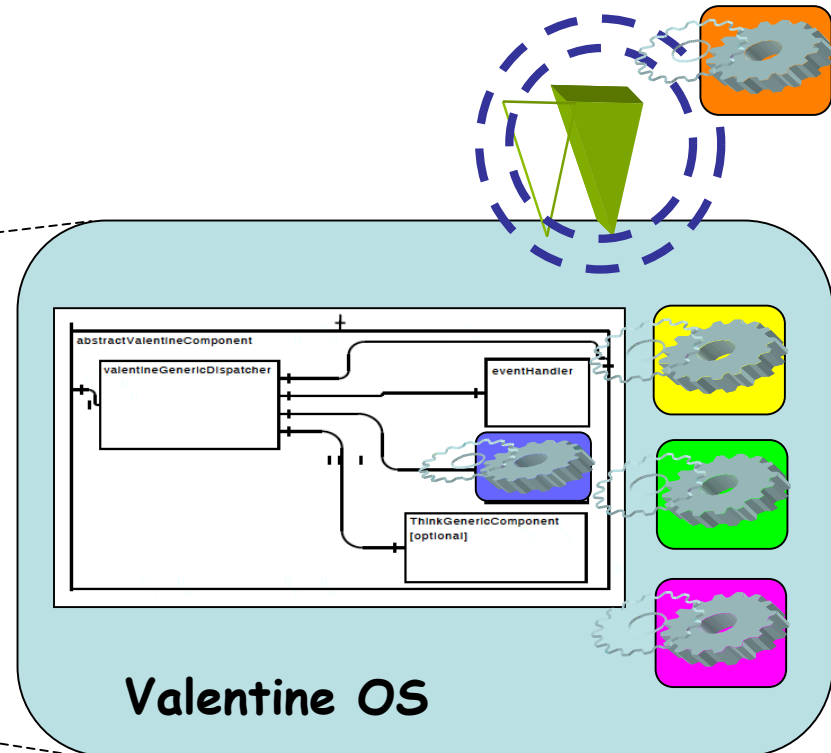

Dynamic reconfiguration (1)

N. Hoang (PhD student)

- ❑ Avoids monolithic OS (à la TinyOS)
- ❑ We use the Think framework, which is an implementation of the Fractal component model to generate dynamic and reconfigurable OS and services
- ❑ First step towards the « active and programmable networking » concept applied to Wireless Sensor Networks

Dynamic reconfiguration (2)

- ❑ Target platform: MicaZ
- ❑ Extension of the Think generic components
→ Valentine OS

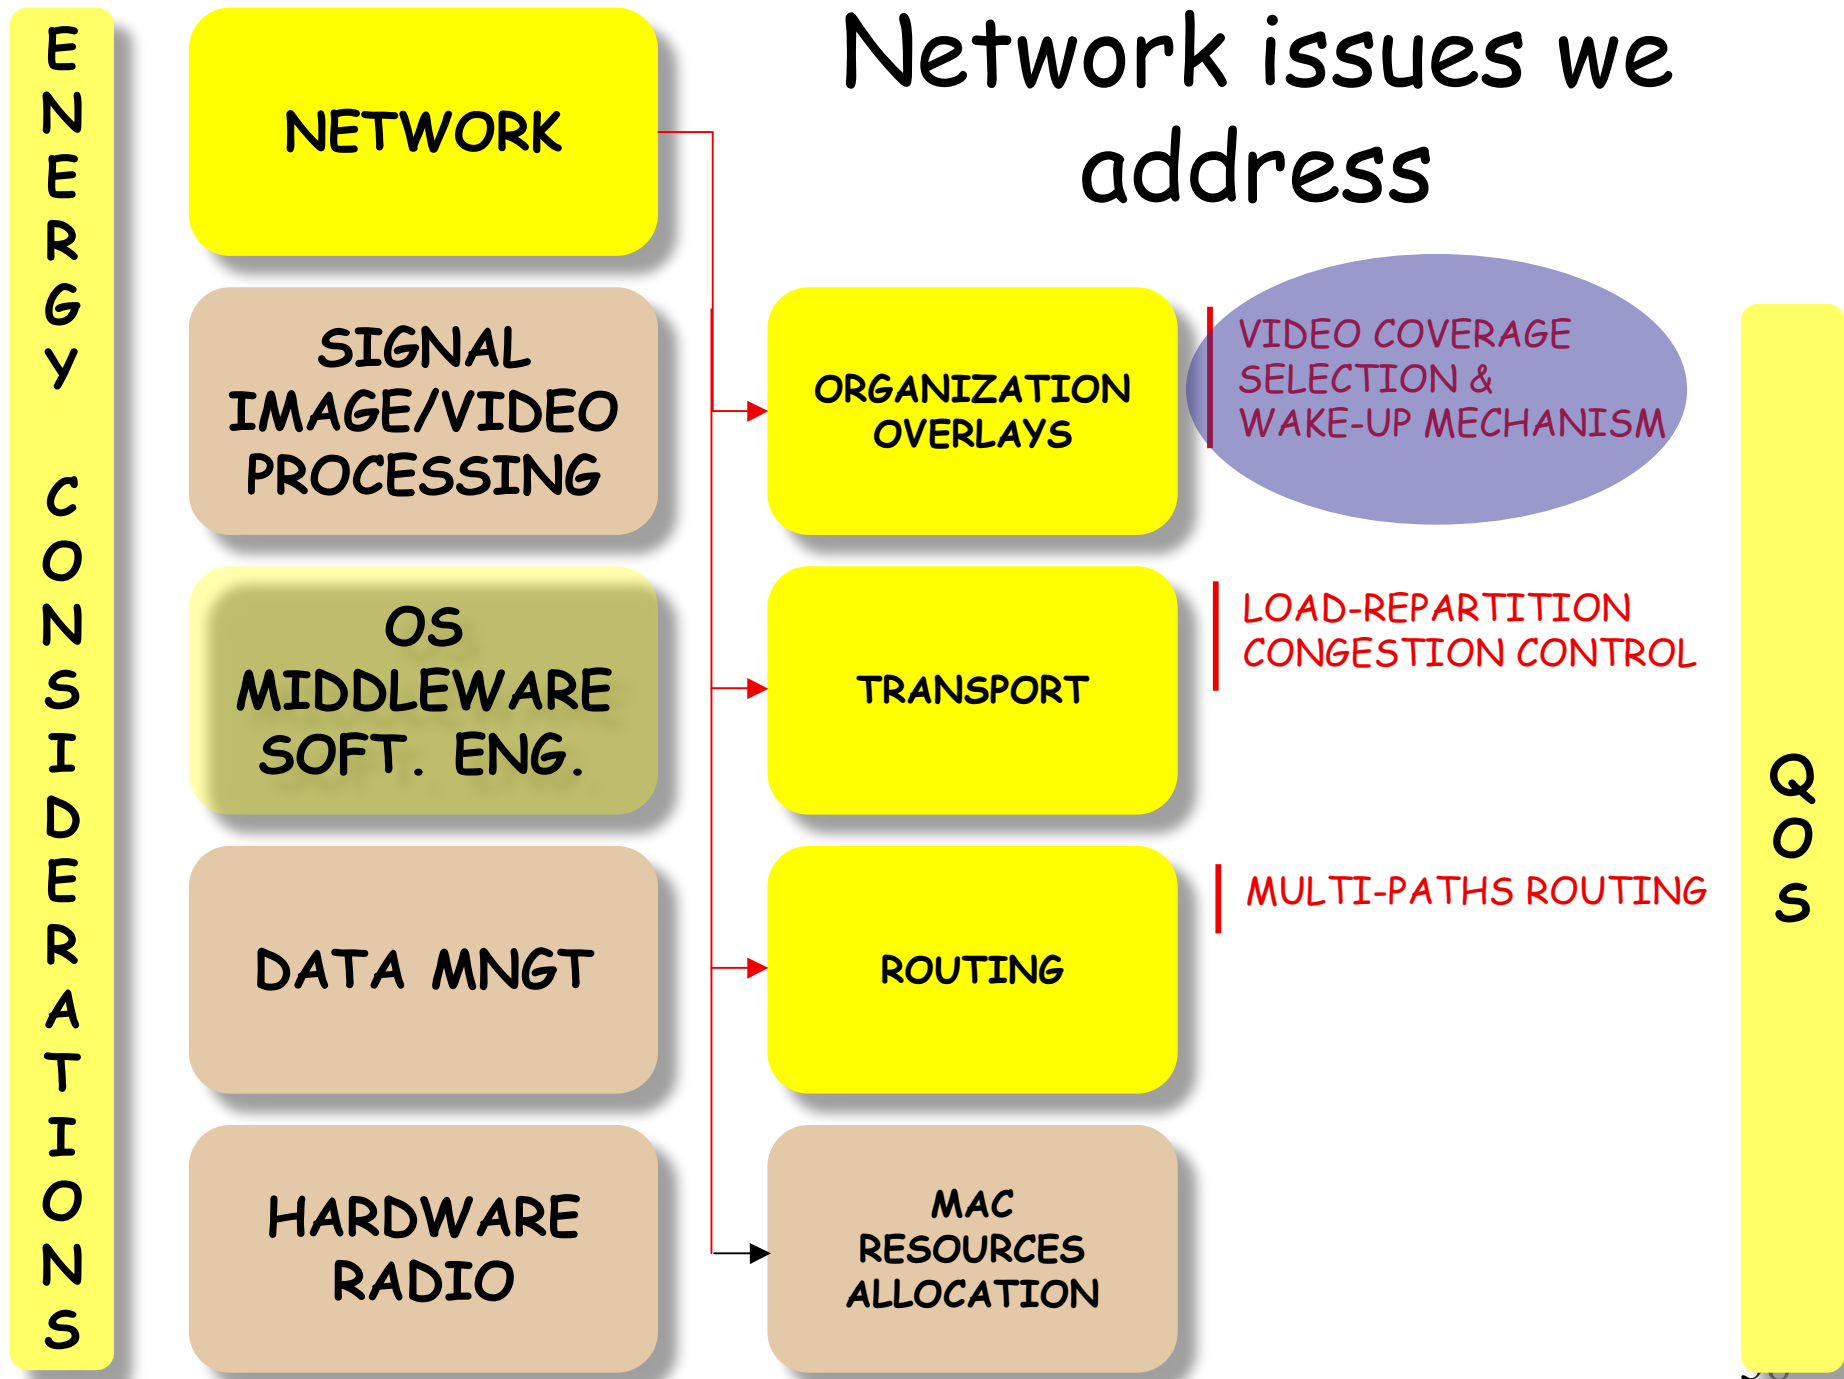

Towards Service Oriented Architecture

- Fast reconfiguration enables dynamic and on-the-fly new services deployment

Network issues we address

Surveillance scenario (1)

- ❑ Randomly deployed video sensors
- ❑ Not only barrier coverage but general intrusion detection
- ❑ Most of the time, network in so-called *hibernate mode*
- ❑ Most of active sensor nodes in *idle mode* with low capture speed
- ❑ Sentry nodes with higher capture speed to quickly detect intrusions

● SENTRY NODE: NODE WITH HIGH SPEED CAPTURE (HIGH COVER SET).

○ IDLE NODE: NODE WITH LOW SPEED CAPTURE.

Surveillance scenario (2)

- ❑ Nodes detecting intrusion must alert the rest of the network
- ❑ 1-hop to k-hop alert
- ❑ Network in so-called *alerted mode*
- ❑ Capture speed must be increased
- ❑ Resources should be focused on making tracking of intruders easier

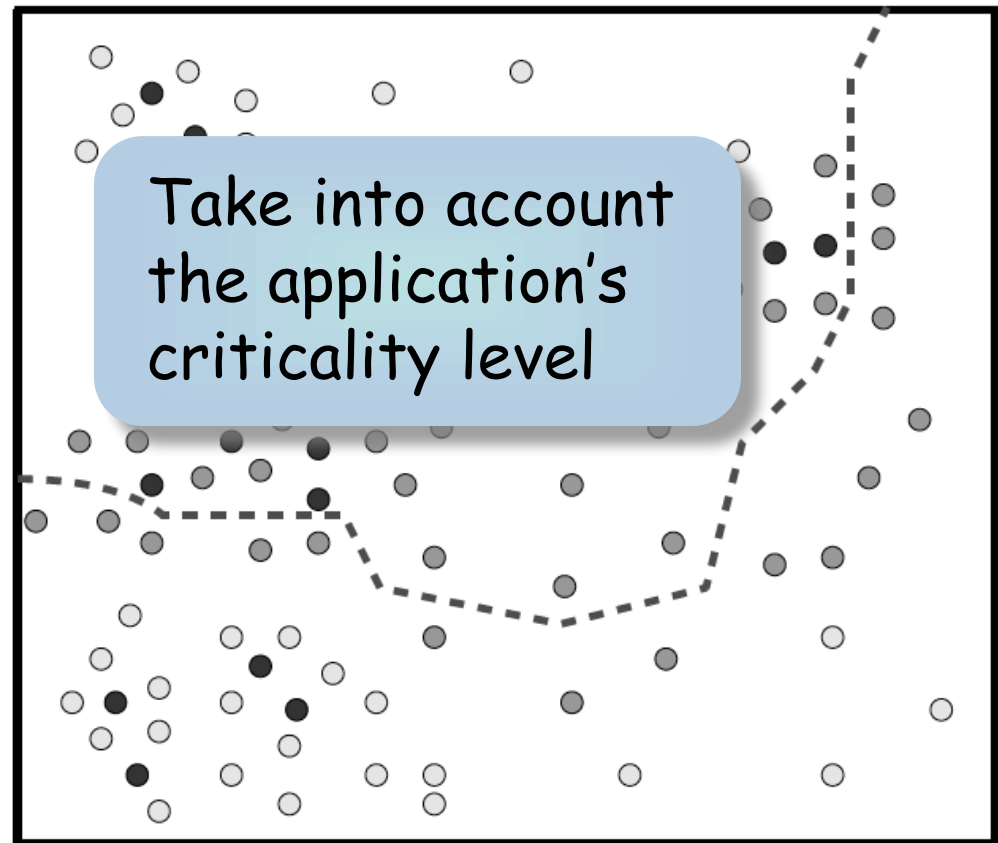

● ALERTED NODE: NODE WITH HIGH SPEED CAPTURE (ALERT INTRUSION).

Surveillance scenario (3)

- ❑ Network should go back to *hibernate mode*
- ❑ Nodes on the intrusion path must keep a high capture speed
- ❑ Sentry nodes with higher capture speed to quickly detect intrusions

- SENTRY NODE: NODE WITH HIGH SPEED CAPTURE (HIGH COVER SET).
- CRITICAL NODE: NODE WITH HIGH SPEED CAPTURE (NODE THAT DETECTS THE INTUSION).
- IDLE NODE: NODE WITH LOW SPEED CAPTURE.

Application's criticality

- ❑ All surveillance applications may not have the same criticality level, $r^0 \in [0,1]$
 - ❑ Environmental, security, healthcare,...
- ❑ Capture speed should decrease when r^0 decreases
- ❑ Sensor nodes could be initialized with a given r^0 prior to deployment

How to meet app's criticality

- ❑ Capture speed can be a « quality » parameter
- ❑ Capture speed for node v should depend on the app's criticality and on the level of redundancy for node v
- ❑ V 's capture speed can increase when as V has more nodes covering its own FoV - cover set

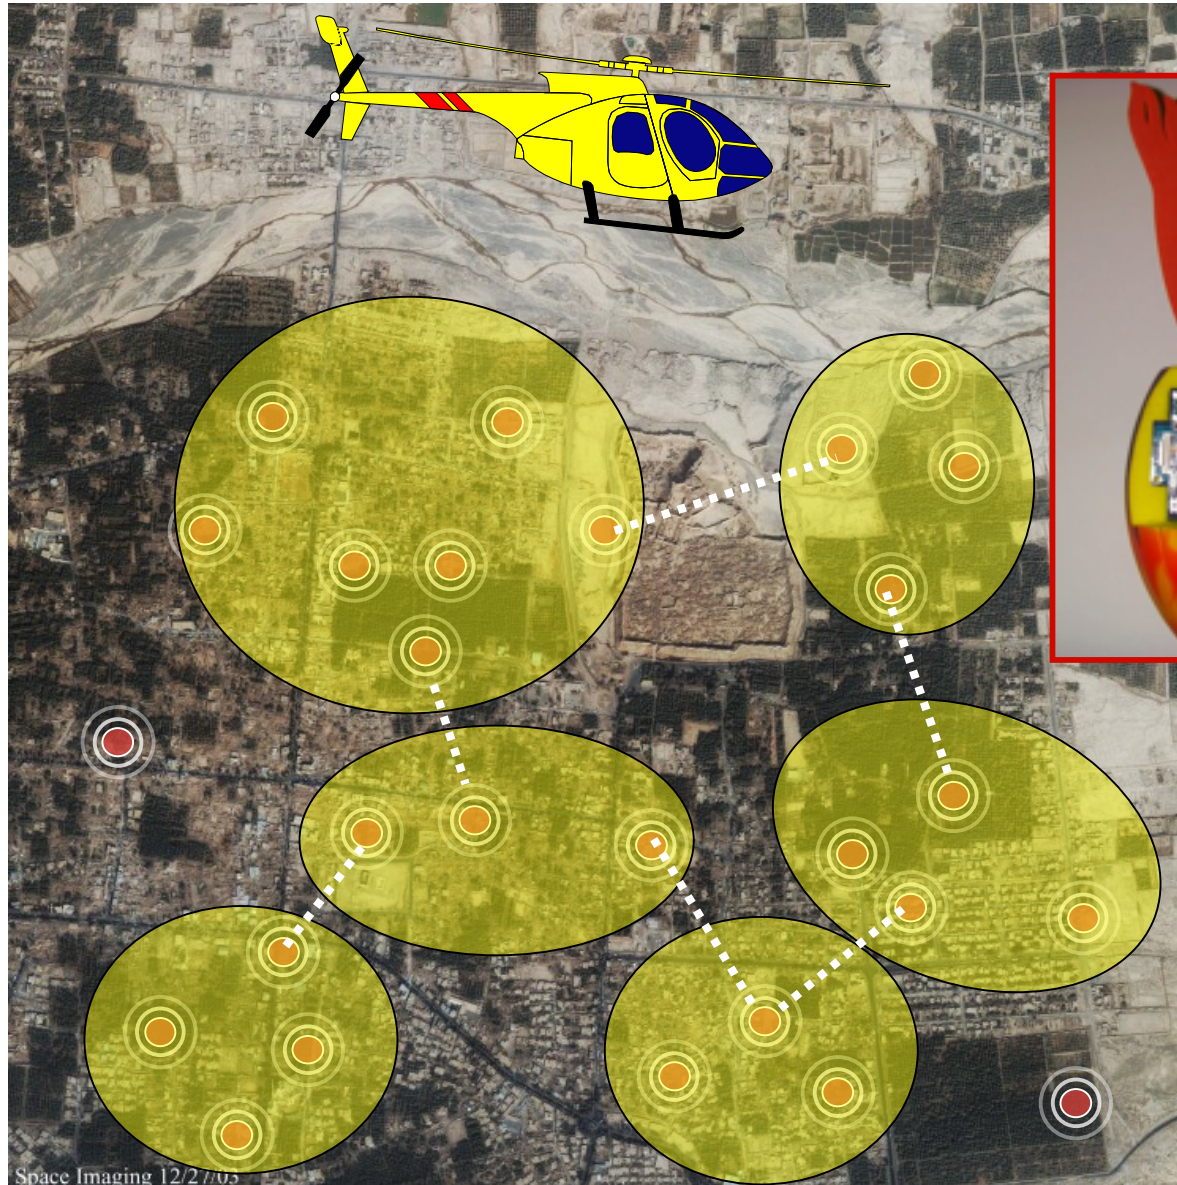

Video Sensor Nodes

Imote2

Multimedia board

Node's cover set

- ❑ Each node v has a Field of View, FoV_v
- ❑ $Co_i(v)$ = set of nodes v' such as $\bigcup_{v' \in Co_i(v)} FoV_{v'}$ covers FoV_v
- ❑ $Co(v)$ = set of $Co_i(v)$

$$Co(v) = \{V_1, V_2, V_3, V_4\}$$

Finding v's cover set

$A = \{v \in N(V) : v \text{ covers the point "a" of the FoV}\}$
 $B = \{v \in N(V) : v \text{ covers the point "b" of the FoV}\}$
 $C = \{v \in N(V) : v \text{ covers the point "c" of the FoV}\}$
 $G = \{v \in N(V) : v \text{ covers the point "g" of the FoV}\}$

$AG = \{A \cap G\}$
 $BG = \{B \cap G\}$
 $CG = \{C \cap G\}$
 $Co(v) = AG \times BG \times CG$

$Co(V) = \{$
 $\{V\},$
 $\{V2, V1\},$
 $\{V3, V1\},$
 $\{V2, V4, V5\},$
 $\{V3, V4, V5\}$

Criticality model (1)

- ❑ Link the capture rate to the size of the cover set
- ❑ High criticality
 - ❑ Convex shape
 - ❑ Most projections of x are close to the max capture speed
- ❑ Low criticality
 - ❑ Concave shape
 - ❑ Most projections of x are close to the min capture speed
- ❑ Concave and convex shapes automatically define sentry nodes in the network

Criticality model (2)

- ❑ r^0 can vary in $[0,1]$
- ❑ Behavior functions (BV) defines the capture speed according to r^0
- ❑ $r^0 < 0.5$
 - ❑ Concave shape BV
- ❑ $r^0 > 0.5$
 - ❑ Convex shape BV
- ❑ We propose to use Bézier curves to model BV functions

BehaVior function

$$B(t) = (1 - t)^2 * P_0 + 2t(1 - t) * P_1 + t^2 * P_2$$

Some typical capture speed

- ❑ Maximum capture speed is 6fps
- ❑ Nodes with size of cover set greater than 6 capture at the maximum speed

$r^0 \backslash Co(v) $	1	2	3	4	5	6
0.0	0.05	0.20	0.51	1.07	2.10	6.00
0.2	0.30	0.73	1.34	2.20	3.52	6.00
0.5	1.00	2.00	3.00	4.00	5.00	6.00
0.8	2.48	3.80	4.66	5.27	5.70	6.00
1.0	3.90	4.93	5.49	5.80	5.95	6.00

320x200, 30 fps, 256 gray scale
15Mbps raw

5 fps, 4 gray scale, 640kbps raw

2 fps, 4 gray scale, 256kbps raw

1 fps, 4 gray scale, 128kbps raw

Simulation settings

- ❑ OMNET++ simulation model
- ❑ Video nodes have communication range of 30m and video sensing range of 25m, FoV is a sector of 60°
- ❑ Battery has 100 units
- ❑ Full coverage is defined as the region initially covered when all nodes are active

Percentage of active nodes

Percentage of coverage

Average capture speed

Fixed vs adaptive

Conclusions

- ❑ Surveillance applications have a high level of criticality which make accountability important
- ❑ Criticality model with adaptive scheduling of nodes
- ❑ Optimize the resource usage by dynamically adjusting the provided service level
- ❑ Extension for risk-based scheduling in intrusion detection systems

Research directions

PERVASIVE AND UBIQUITOUS SYSTEMS

Controlled propagation (1)

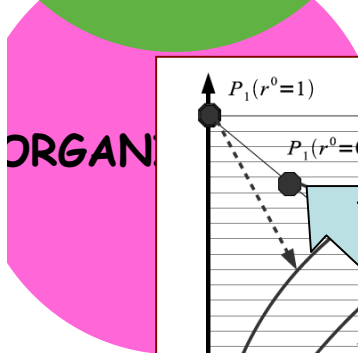

● SENTRY NODE: NODE WITH HIGH SPEED CAPTURE (HIGH COVER SET).

○ IDLE NODE: NODE WITH LOW SPEED CAPTURE.

Controlled propagation (2)

- ALERTED NODE: NODE WITH HIGH SPEED CAPTURE (ALERT INTRUSION).

Controlled propagation (3)

- Not a simple propagation or broadcast algorithm
 - Not all nodes need to be at the maximum (same) alert level
 - Which nodes should be more than others?
- Borrow propagation model from other disciplines
 - Epidemic propagation, percolation, wave propagation,...
 - According to the model, map the parameter of a surveillance system to the model's parameters

Controlled propagation (4)

ex: tsunami generation

SCHEDULING

ORGANIZATION

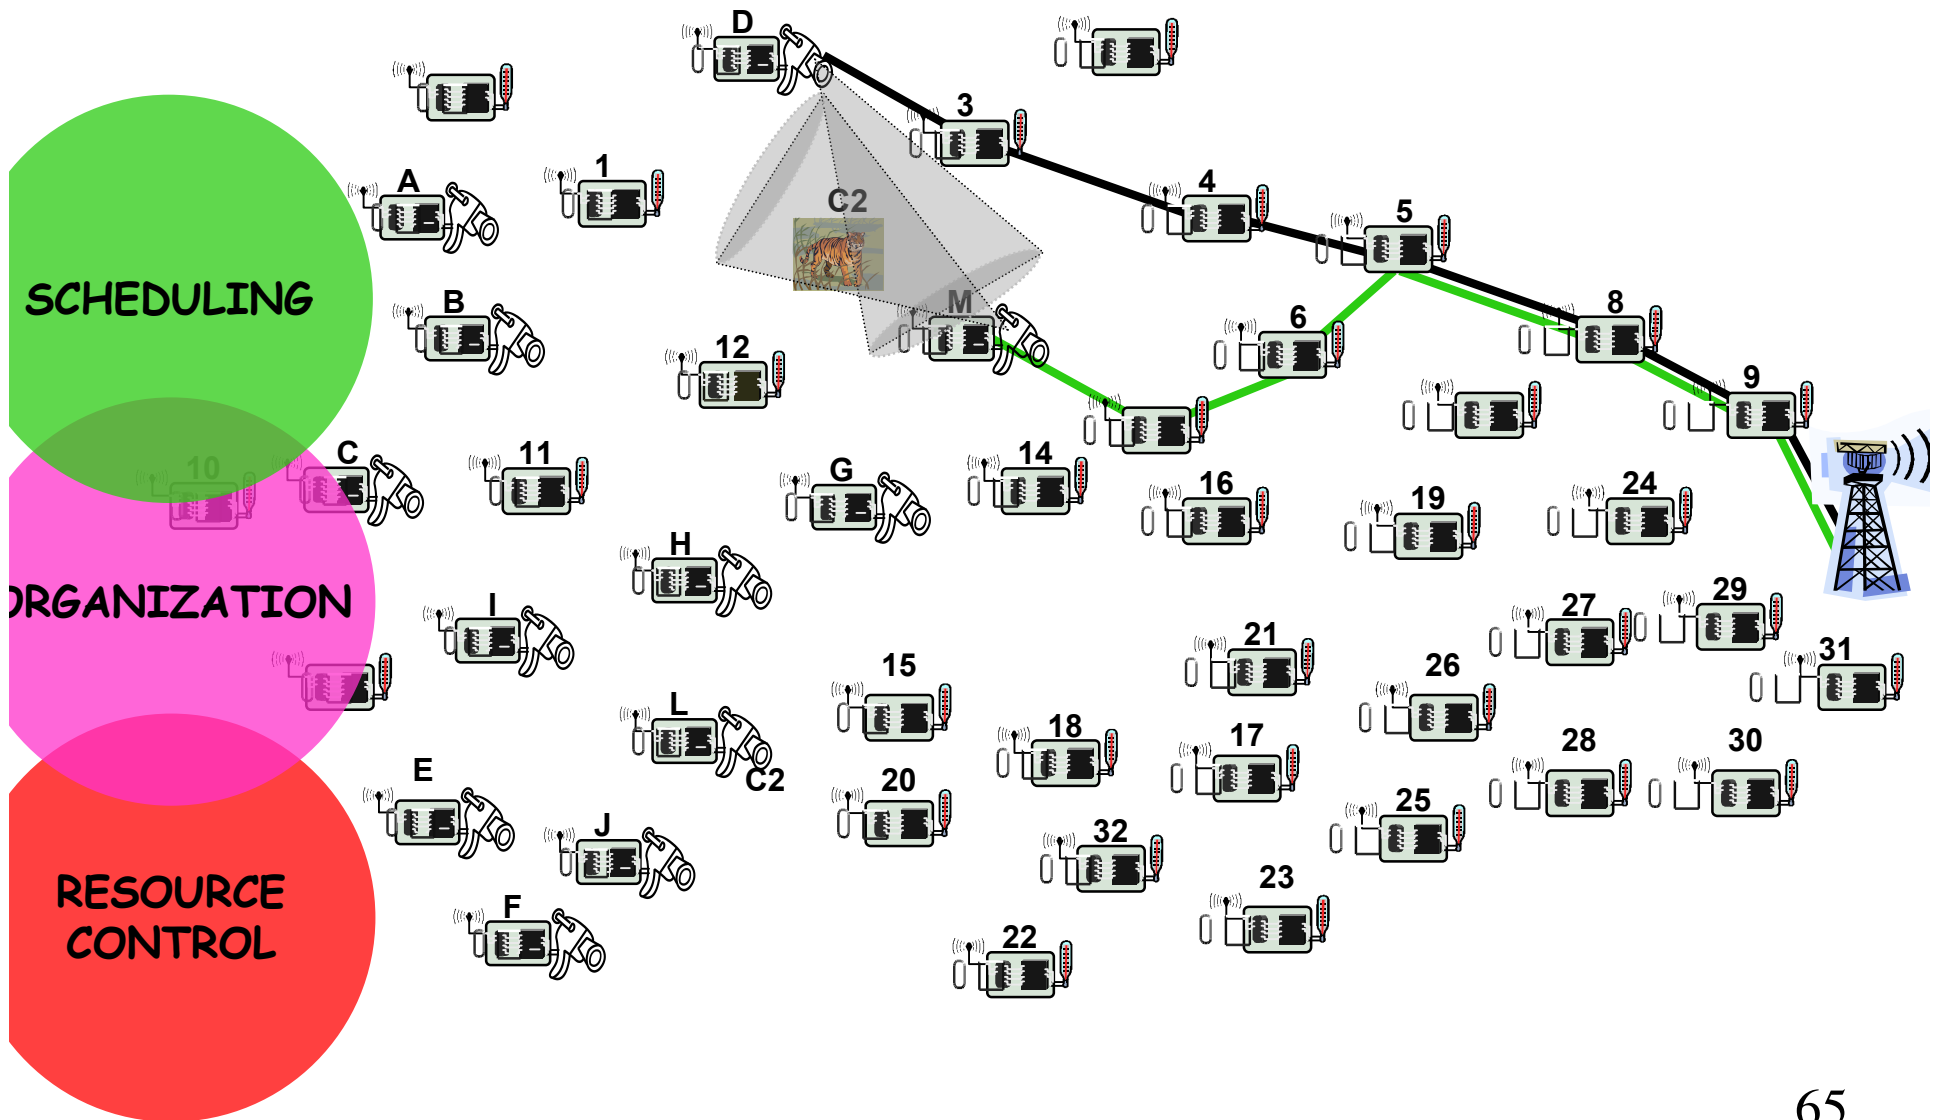

sensor nodes near the border may need to be « alerted » than others, they could have an amplification factor greater than those near the centre

Congestion control (1)

- ❑ Lot's of sensor nodes=lot's of trafic
- ❑ High probability of bottleneck, lot's of packet drop, no useful data back to user!
- ❑ Scheduling is tightly linked to resource control to be efficient
- ❑ Scheduling is then not only find these nodes that « see » the event, but also how to select a subset of those nodes that minimizes congestion

Congestion control (2)

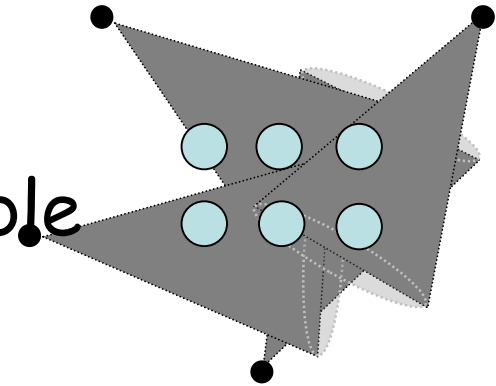

Congestion control (3)

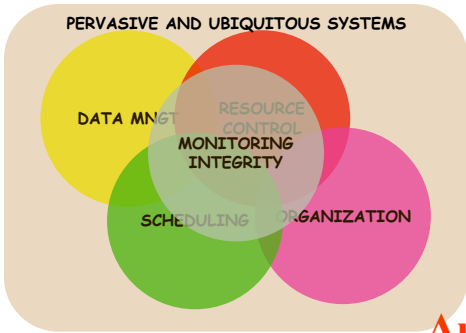

Scheduling cover-set

- On intrusion, it is desirable to use more camera
 - To circumvent occlusions
 - To help for disambiguation
- It is not necessary that all activated camera capture at a same speed (probably high speed)
 - How define different the target frame capture speed for each node of the same cover set?

Towards wide-area situation awareness

Authorised User

Combination of randomly and manually deployed sensors
